

Environmental Data WebGIS

BMT WBM has extensive experience in delivering high quality outcomes in a range of Geographic Information Systems (GIS) projects. We take great pride in the output of our work, and we are highly regarded for the quality and presentation of spatial data. Our approach to presenting GIS data is technically advanced and often innovative, including the creation of Web Geographic Information System (GIS) sites.

BMT WBM was commissioned by SEQWater to create an interactive WebGIS principally containing information regarding environmental data. The data was entered into SEQWaterWebMap using an appropriate projection system allowing for the better understanding of, and location of SEQWater assets, with associated attributes. These assets can simply be displayed and investigated as required.

The Web GIS is hosted on a secure server at BMT WBM.
